

Institutional Planning and Analysis

CAL POLY

First-Time Freshman Graduation, Retention, and Attrition Analysis

Five-year trends of various retention, graduation, and attrition data of entering first-time freshman cohorts for each program at Cal Poly including comparison data at the college and university level.

CAL POLY

Program Graduation, Retention, and Attrition Analysis

Executive Summary

Cal Poly is promoting an effort to increase graduation and retention rates. The office of Institutional Planning & Analysis has compiled a set of data to provide an understanding of Cal Poly's current graduation and retention rates. These data reveal specific program areas that are doing well and areas that have a potential for improvement.

The key findings and implications from this analysis can be summarized around five major points.

1. Colleges and programs vary distinctly based on the measures and time-frames of this study. One key example of these differences occurs in the fact that students in CLA and CBUS graduate sooner, in their fourth or fifth year, as opposed to students in CENG or CAED who tend to graduate in their fifth or sixth year. CAED does have two five-year programs that contribute significantly to this difference.
2. There have been distinct jumps in graduation rates at particular points-in-time. The four-year graduation rate jumped with the Fall 1999 cohort and the five-year and six-year graduation rates jumped with the Fall 1998 cohort.
3. The majority of students who have left Cal Poly as juniors or seniors, left in good academic standing¹.
4. About half of the students who left Cal Poly after one year, left in poor academic standing.
5. Students who change their major at some point in their academic career at Cal Poly have higher graduation rates than students who stay in their original major.

Definitions and Scope of Analysis

This analysis focuses only on entering first-time freshman cohorts from each Fall term back to Fall 1995. As first-time freshmen make up approximately 75-80% of new undergraduates each Fall, focusing on this type of student provides a good sense of student success at Cal Poly.

First-time freshmen are defined by using the federal student-right-to-know definition that is used for IPEDS and NCAA graduation rate reporting. This definition includes any students who meet the following two criteria: (1) Entering post-secondary education for the first time in Fall or the previous Summer term and (2) Enrolled Full-Time (12 or more units) in the Fall term.

¹ Standing is based on the students' Cal Poly GPA at the end of the last term enrolled. For this study, students with a Cal Poly GPA of 2.00 or higher are considered in good standing. IP&A realizes that specific programs have additional measurements regarding standing. GPA data is the only quantitative measure available to show whether or not a student is succeeding in coursework.

To account for the fact that students change majors during their career at Cal Poly, IP&A has created a method to “adjust” the cohorts to make graduation rates more meaningful at the program and college level. This adjustment is done by associating each student from the cohort with their program of record as of graduation or as of the last Fall term enrolled within the time-frame addressed. For example, a student who entered Cal Poly as a Psychology major but changed to Journalism is considered part of Journalism’s “adjusted” cohort. The number of students in an “adjusted” cohort for a particular program can vary when looking at six-year graduation rates as compared to four or five year graduation rates. This occurs due to the timing of when a student changes major. If the student in the previous example changed major during their fifth year, s/he would still be in the Psychology cohort for the four-year graduation rate and then move to the Journalism cohort for the five-year graduation rate. Please note that adjustments are not made on the cohorts for one-year retention rates because few students change major within the first year.

This analysis is comprised of the following nine components, with data at the program as well as college and university levels:

Table 1) Cal Poly Historical Cohort Retention/Graduation

A historical look at total university retention and graduation rates for first-time freshman and new transfer cohorts back to Fall 1990.

Table 2) Six-Year Graduation Rates (five year trends)

The percentage of entering freshmen who graduated within six years of matriculation

Table 3) Six-Year Drop-Out Rates (five year trends)

The percentage of entering freshmen who, after six years, have not graduated and are no longer enrolled

Table 4) Detailed Analysis of Six-Year Drop-Outs from the Fall 1999 Cohort

The exit level and exit Cal Poly GPA of students from the Fall 1999 freshman cohort who had not graduated within six years and were no longer enrolled in the seventh Fall term after matriculation

Table 5) Detailed Analysis of Six-Year Graduation Rates for Major Changes from the Fall 1999 Cohort

The percentage of students from the Fall 1999 freshman cohort who graduated within six years of matriculation

Table 6) One-Year Retention Rates (five year trends)

The percentage of entering freshmen who returned Fall term, one year after matriculation

Table 7) Detailed Analysis of One-Year Drop-Outs from the Fall 2004 Cohort

The exit term and exit Cal Poly GPA of students from the Fall 2004 freshman cohort who did not return the following Fall term, one year after matriculation

Table 8) Four-Year Graduation Rates (five year trends)

The percentage of entering freshmen who graduated within four years of matriculation

Table 9) Five-Year Graduation Rates (five year trends)

The percentage of entering freshmen who graduated within five years of matriculation

The tables that show five year trends have an additional column that shows the five-year average. This statistic averages out five years of fluctuations in rates. There were

two reasons for including this statistic in the study: 1) It reduces five years of data into one simple value and 2) it allows for better comparisons for small programs that have large variations in rates from year-to-year.

In reading the tables, we have a few suggestions to better understand what to look for:

- It is appropriate to compare a rate for a particular program with that of its corresponding college or the overall university rate for the same cohort. However, do not, for example, compare the Psychology rate for the 1999 cohort with the Liberal Arts rate for the 1997 cohort.
- It is a good idea to look at the fluctuations in the rates over the five year trends compared against corresponding college or university fluctuations and also compared to the five-year average. For example, are rates higher than average in more recent years or in the earlier years?
- Always stay mindful of the size of the cohorts. A program with a cohort of 4 students can only have 5 rates (0%, 25%, 50%, 75%, 100%). One student can make a difference of 25 percentage points in the rate.
- Also, be cognizant of aberrations in the rates that can be explained by extenuating circumstances. For example, a change in catalog requirements or a raise in tuition that causes students from a particular cohort to rush completion.

Comments for Each Component

Table 1: Cal Poly Historical Cohort Retention/Graduation

This table provides an overview of how Cal Poly's overall retention and graduation rates have changed since 1990. The six-year graduation rate for first-time freshmen has increased over 10 percentage points from the 1990 cohort to the 1999 cohort. There is a comparable increase in average SAT and high school GPA's over that time period that could contribute to the increase in graduation rate. It is well worth mentioning that the four-year graduation rate for first-time freshmen has increased over 14 percentage points since 1990.

Table 2: Six-Year Graduation Rates

The most recent six-year graduation rate for Cal Poly is 68.9% (based on the Fall 1999 cohort). The six-year graduation rate was 66.0% for the Fall 1995 cohort, dropped to 64.4% for the Fall 1996 cohort, but has been increasing since with a relatively large jump of 3.3 percentage points for the Fall 1998 cohort.

Chart 1

The Orfalea College of Business consistently has the best six-year graduation rate among the colleges with a current rate of 86.6% from the Fall 1999 cohort. The College of Liberal Arts is also consistently above the university six-year graduation rate. The College of Engineering has the lowest five-year average six-year graduation rate and had the lowest rate among colleges with earlier cohorts. However, CENG’s rates increased with the 1998 and 1999 cohorts, moving them ahead of the College of Architecture and Environmental Design. The College of Agriculture and CAED are consistently below the university six-year graduation. CAGR came close to the university rate with the 1998 cohort and CAED came close to the university rate with the 1997 cohort. The College of Science and Mathematics tends to stay at a level similar to that of the overall university with the exception of the 1995 and 1999 cohorts where they were quite a bit lower. Programs with average six-year graduation rates above 80% are as follows:

- Liberal Studies
- Communication Studies
- Business Administration
- Industrial Technology
- Child Development
- Psychology

Table 3: Six-Year Drop-Out Rates

This table focuses on students who, after six years, had not graduated and are no longer enrolled. It is almost an inverse of the six-year graduation rate table except that it excludes students that are still enrolled and should not be considered “drop-outs.” This provides a picture of students who left Cal Poly for some reason and would be the focus of efforts to improve graduation rates by determining reasons for leaving and providing measures to minimize them. An effort could be made to urge students who are still enrolled after six years to finish up sooner, but the potential increase to graduation rates would be smaller.

Table 4: Detailed Analysis of Six-Year Drop-Outs from the Fall 1999 Cohort

This table takes the 775 students from the Fall 1999 cohort who did not graduate and are no longer enrolled and provides information about their class level and Cal Poly

GPA when they left Cal Poly. This analysis revealed an interesting phenomenon whereby 29.0% of these students left as seniors in good standing (2.00+ GPA). While 37.2% of the students left as freshmen, almost two thirds of these freshmen were in poor standing when they left. Two other sizable proportions of drop-outs are freshmen in good standing (13.3%) and sophomores in good standing (14.8%). This shows that there is no single reason as to why students leave Cal Poly. Efforts could be made to help students perform better in the early stages of their academic career, but there is also a marked need for determining to what extent various possible reasons (i.e. senior project, graduation writing requirement, etc.) may explain why Cal Poly is losing so many seniors who are in good standing.

It is interesting to note the differences in these proportions among the colleges and individual programs. The College of Liberal Arts tends to have a slightly higher proportion of students leaving as seniors in good standing whereas, the Orfalea College of Business and the College of Engineering have a higher proportion of students leaving as freshmen in poor standing.

Table 5: Detailed Analysis of Six-Year Graduation Rates for Major Changes from the Fall 1999 Cohort:

This table provides a look at how changes in majors can affect the six-year graduation rates. A very telling factor here is that out of the 784 students from the Fall 1999 cohort who changed their major sometime during their academic career, 80.1% of them graduated within six years. In contrast, only 64.7% of students who did not change their major, graduated within six years. This seems a little deceptive at first, but two factors make this pattern more understandable. 1) A majority of students leave in their first couple of years and 2) The majority of major changes happen after the first couple of years. Combining these two factors can begin to explain these disparate graduation rates in that there is a group of students who leave before thinking about changing their major and students who change their major are more invested in completing their education.

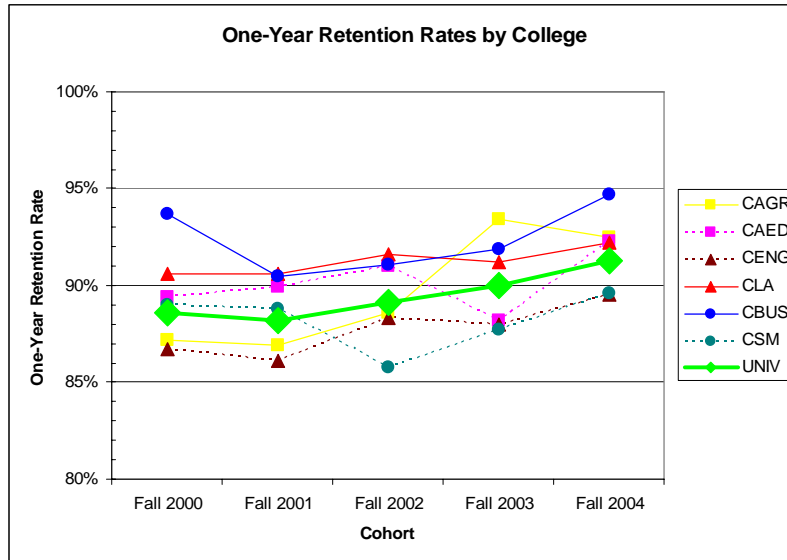

A good measure to use from this table is to compare the graduation rate of the original cohort with that of the “adjusted” cohort. This reveals the effect of major changes on particular programs. Programs that lose a lot of students to other majors will tend to have lower graduation rates for the “adjusted” cohort. While programs that bring in these major changes will tend to have their “adjusted” cohort graduation rates enhanced.

One caution about a nuance of this table is that students who change majors within a college are not considered major changes for college totals. Thus, the college totals for the “No Change”, “Changed Out”, and “Changed In” columns are not the sum of the programs within the college.

Table 6: One-Year Retention Rates

The current one-year retention rate for Cal Poly is 91.3% based on the Fall 2004 cohort. The five year trends for one-year retention show that the rate dipped slightly from the 2000 cohort to the 2001 cohort, but has been steadily climbing since.

Chart 2

As shown in the above graph, one-year retention rates among colleges are less consistent than the six-year graduation rates shown previously. The College of Agriculture shows a rather large increase over the five years with a jump of 6.5 percentage points from the 2001 cohort to the 2003 cohort.

Table 7: Detailed Analysis of One-Year Drop-Outs from the Fall 2004 Cohort

Only 251 students from the Fall 2004 cohort left after their first year. When you further split this number by program the numbers get quite small, causing difficulty in getting meaningful results from one-year drop-out analysis at the program level.

One meaningful piece of information from this table is that of the 251 students who left Cal Poly after their first year, they are split about 50/50 in terms of good vs. poor standing. Another interesting fact is that approximately 75% of these drop-outs stayed for the full year dropping-out after Spring quarter rather than leaving after one quarter as is sometimes thought.

The colleges differ quite dramatically in terms of GPA standing of one-year drop-outs. A higher proportion of one-year drop-outs from the Colleges of Agriculture and Engineering are in poor standing while the reverse is true for the Colleges of Liberal Arts, Business, and Science and Mathematics. Students are more apt to meet academic expectations in these latter three colleges and still leave.

Table 8: Four-Year Graduation Rates

The most recent four-year graduation rate for Cal Poly is 21.7% based on the Fall 2001 cohort. This rate has stayed fairly steady with the past three cohorts (1999,2000,2001) after a jump of 4.5 percentage points from the Fall 1998 cohort to the Fall 1999 cohort.

Chart 3

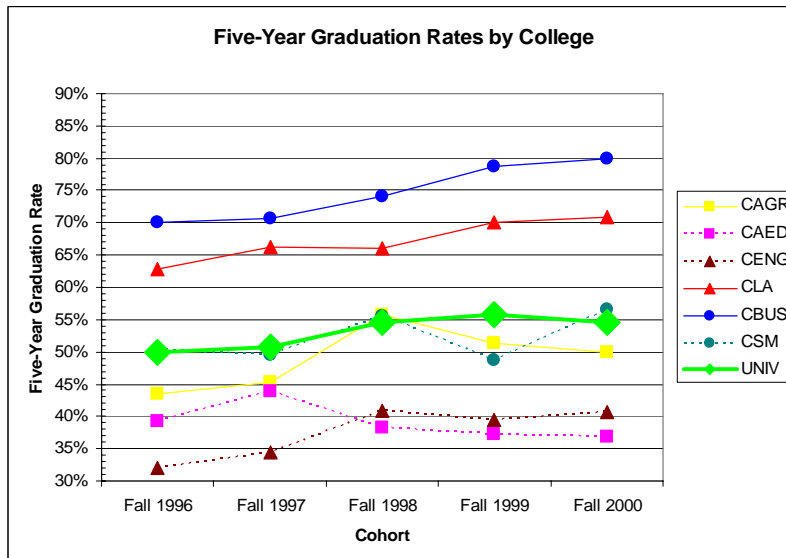

Again when looking at graduation rates, the Orfalea College of Business and the College of Liberal Arts stand out above the other colleges. The Colleges of Architecture and Environmental Design and Engineering have low four-year graduation rates, particularly understandable for CAED with two five-year programs.

Table 9: Five-Year Graduation Rates

The most recent five-year graduation rate for Cal Poly is 54.6% based on the 2000 cohort. The five-year graduation rate for the entire university jumped 3.8 percentage points from the 1997 cohort to the 1998 cohort, peaked at 55.7% with the 1999 cohort and dipped down to 54.6% with the 2000 cohort.

Chart 4

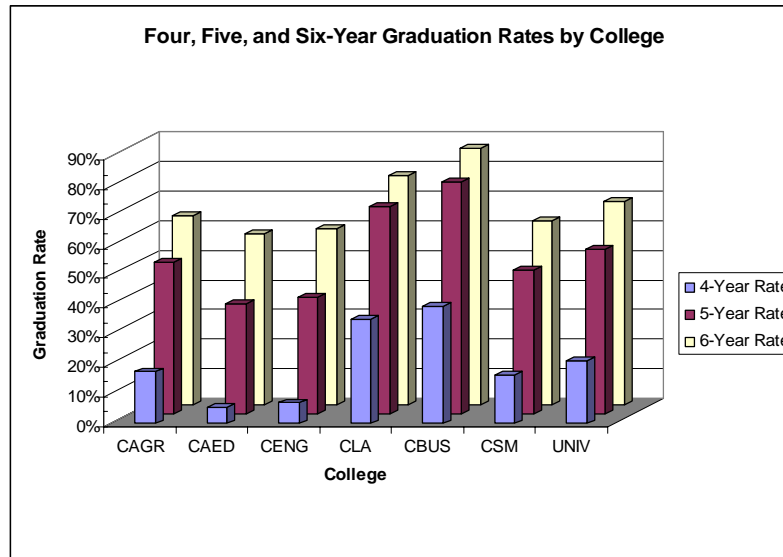

Five-year graduation rates among the colleges are actually more similar to the four-year graduation rates than to the six-year graduation rates. CAED and CENG still lag behind in the five-year graduation rates.

Comparison of four, five, and six year graduation rates by college

It is interesting to note that the rate increases from the four-year rate to the five-year rate are all fairly similar among the colleges. Each college increases about 30-35 percentage points from their four-year rate to their five-year rate. The disparity among the colleges happens either early with the four-year rates or later with the six-year rates.

Chart 5

For example, CAED and CENG both have rather low four-year rates. They each jump 30-35 percentage points for their five-year rate and then jump again another 20 percentage points to get to their six-year rate. Conversely, CBUS and CLA start rather high with their four-year rate, jump 30-35 percentage points for their five-year rate, but only increase about 5-10 percentage points to get to their six-year rate. What this says is that most of the CLA and CBUS students graduate within four or five years, whereas most of the CAED and CENG students graduate within five or six years.

Summary and Recommendations

These tables provide an opportunity for programs to have comparison data to assess their retention and graduation performance in relation to their respective college and the university. Also, having five-year trends allows for determining any patterns over time that can be an indicator of the direction programs are heading in terms of retention and graduation rates.

The Orfalea College of Business and the College of Liberal Arts are generally the best performers among colleges in retention and graduation. The College of Engineering and the College of Architecture and Environmental Design are generally under-performing in comparison with the other colleges. The College of Science and Mathematics tends to be average, hovering around the overall university rates. The College of Agriculture also tends to be average, except that it tends to have more specific deviations from the norm.

The information provided in this analysis is drawn from the student information system so it cannot be used to explain “why” students leave. Therefore, further studies need to

be conducted to focus on students that leave Cal Poly in an effort to ascertain reasons for their departure.

The information on graduation rates for major changes (Table 5) may indicate that better facilitation of allowing students to change majors could be a possibility for increasing graduation rates. Since most students leave in the first two years, efforts along these lines would be in better initial placement in programs and better advising in the early years to determine alternatives if the initial fit was not right.

Another aspect revealed was from the exit status of drop-outs (Table 4). It is quite troublesome to see such a high percentage of students leaving as seniors in good standing. Further investigation would have to be done to provide better explanation, but other studies and conjecture suggests that a significant portion of this group is lured away by employers, delaying completion of their senior projects. Another suggestion may be that students are “stopping-out” late in their academic career, but this is not substantiated since extending graduation rates out to 7-10 years results in a very minimal increase in completion rates.

Possibilities for Further Analysis

There are many more views that can be produced for this data, but the tables provided in this analysis are probably the most pertinent. We could look at four-year or five-year drop-out rates, but they are fairly comparable to the six-year drop-out rate since most students leave within their first 2-3 years. Looking at a two-year retention rate might also be beneficial however, I suspect that the patterns among programs and colleges would be somewhat similar to those of the one-year retention rates.

We could also look at retention and graduation data for transfers, but as mentioned earlier they only comprise approximately 20-25% of new undergraduates and by nature are less apt to be affected by efforts to increase their graduation rates. Transfer students have already invested resources into their education and by the time they hit Cal Poly have decided on a course of action that is not as likely to be altered. However, this should not imply that graduation rate improvement efforts on transfers would be a waste of time. Transfer graduation rates have improved dramatically since 1990, as shown in Table 1, and might still have room for improvement.

Another possible area of further analysis is to compare our graduation rates with a set of peer or competitor institutions to determine benchmarks or goals to achieve.

* Five-Year Programs

** Students who change majors within a college are not considered major changes for college totals. Thus, the college totals for the "No Change", "Changed Out", and "Changed In" columns are not the sum of the programs within the college.

Cohorts are adjusted to represent students from the overall cohort who were associated with the program as of graduation or as of the last Fall term enrolled within the five-year time frame.
