Puzzle of the Week
Nov 14-20, 2013

Another past Putnam problem:

Let $E$ denote the ellipse $\frac{1}{9}x^2 + y^2 = 1$. Let $A$ be the area of the region in the first quadrant bounded by the line $y = \frac{1}{2}x$, the $x$-axis, and $E$. Find the positive number $m$ such that $A$ is equal to the area of the region in the first quadrant bounded by the line $y = mx$, the $y$-axis, and $E$.

Solutions should be submitted to Morgan Sherman:
Dept. of Mathematics, Cal Poly
Email: sherman1 -AT- calpoly.edu
Office: bldg 25 room 310
before next Thursday. Those with correct and complete solutions will have their names listed on the puzzle’s web site (see below) as well as in next week’s email announcement. Anybody is welcome to make a submission.

http://www.calpoly.edu/~sherman1/puzzleoftheweek

Solution: This was on the 1994 Putnam exam as problem A2. The answer is $m = 2/9$.

For $a > 0$ let $U_a$ denote the region bounded by $y = ax$, the $y$-axis, and $E$. Let $L_a$ denote the region bounded by $y = ax$, the $x$-axis, and $E$. One can compute the areas of $U_a$ and $L_a$ directly, or one can simplify matters by using a change of variables: let $\phi$ denote the transformation $x = 3u$, $y = v$. Then $\phi^{-1}(E)$ is just the unit circle in the $u, v$ plane, and if $\ell$ is the line $y = ax$ then $\phi^{-1}(\ell)$ is the line $v = 3au$. Now, $\phi$ is a linear transformation which magnifies all areas by a factor of $|\det \phi| = 3$. So

$$\text{area of } L_a = 3(\text{area of } \phi^{-1}(L_a)) = 3\frac{\arctan 3a}{2}$$

and

$$\text{area of } U_a = 3(\text{area of } \phi^{-1}(U_j)) = 3\frac{\arccot 3a}{2}$$

So the area of $L_{1/2}$ is $\frac{3}{2}\arctan \frac{3}{2}$ while the area of $U_m$ is $\frac{3}{2}\arccot 3m$. Equating the two and solving for $m$ gives the answer above.
